

BXL

**Double
Eccentric
Butterfly**

**Rotary
Control Valve**

VSI/CONTROLS
A PETROLVALVES COMPANY

INTRODUCTION

The BXL control valve is a high performance eccentric disc rotary valve, developed for fluid control on industrial processes, that combine usually high flow rates and low or medium differential pressures.

In addition to allowing accurate fluid control on several disc openings, the exclusive geometry of the BXL disc associated with its double eccentricity, assures a great functioning smoothness and an excellent sealing capacity for long periods.

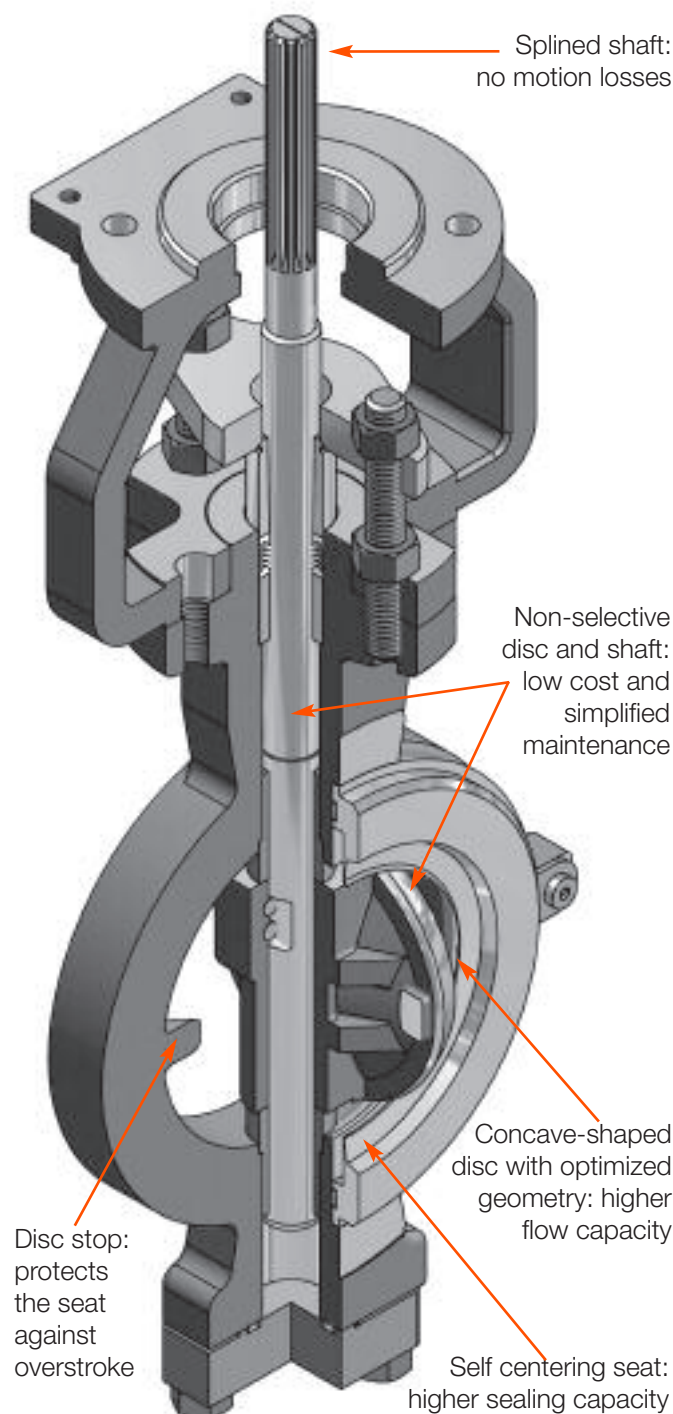

The BXL valve was designed to withstand differential pressures up to 725 psi (50 Bar) and operating temperatures from -40 to 600 °F (-40 to 315 °C).

Available in sizes from 2 to 12 inches with Wafer or Lug style bodies, the BXL valve can be produced in a wide variety of materials such as carbon steel, stainless steel and special alloys with ANSI classes 150 – 300 or DIN PN 16 – 40.

Its advanced engineering design, with non-selective discs and shafts considerably reduces operating costs and simplifies maintenance tasks, while the extra deep packing box with excellent internal finish, allows the utilization of all Valtek Sulamericana packing options available, including special versions for fugitive emissions control.

The combination of the enhanced design of high performance eccentric disc valve, precise and reliable, with the rotary actuators Series RA-XL makes the BXL an exceptional cost-effective choice for those control applications with ANSI ratings 150 and 300.

ANSI Class IV Shutoff – Metal Seat
ANSI Class VI Shutoff – Soft Seat

ECCENTRIC DISC ROTATION (FIGURE 2)

SOFT SEAT - SEATING PRINCIPLE (FIGURE 3)

Reliability

The double eccentricity feature, typical of the high performance BXL valve design (Fig. 2) makes the disc move out from the seat immediately at the first rotation angles of the actuator, which extends the life of the trim, preserves the valve sealing capacity, and reduces maintenance interventions and operational costs.

Additionally, the BXL design uses a pressure-assisted seating principle which, in addition to assuring an excellent level of bi-directional sealing, contributes to reduce the valve breakout torque, at low or significant differential pressures, thus reducing the need of oversized actuators. The fluid pressure press the valve seat against the disc on both flow directions (Fig. 3) making the valve able to operate, depending on process conditions, either with upstream flow (tending to close), downstream flow (tending to open) or in applications with alternate flows. This operating principle assures a tightness capacity through the valve directly proportional to the differential pressure increase.

When supplied with metal seat, the BXL valve reaches tightness levels above those required by ANSI B16.104/FCI-70.2 Class IV and, when equipped with soft seats, meets the Class VI requirements of this same standard. The combination of its low breakout torque with the optimized geometry of the disc, the rugged shaft made from 17-4PH stainless steel as standard material and bearings with broad support surfaces contribute to the superior control performance of the BXL valve, even in applications under higher differential pressures.

These characteristics, together with the use of: spring-cylinder actuators with proven lifetime longer than a million of cycles, HPP1500 Analog or HPP3000 and HPP3500 Digital Positioners, which provide an accurate and refined process control; Packing boxes with large depth that meet the EPA* requirements; splined driving shaft with no motion losses, make the BXL one of the most modern, advanced and accurate eccentric disc control valve in the world market.

*EPA = U. S. Environmental Protection Agency

SEAT CONFIGURATIONS (TABLE I)

The BXL control valve can be provided with several seat configurations, according to the application they are intended for. For liquid services all valves must be assembled with the shaft downstream the flow direction, irrespective of the failsafe position. For gas services, the flow direction must be in according to the specified failsafe position, i.e., normally open valves must be installed with shaft downstream the flow direction and, normally closed valves must be installed with shaft upstream the flow direction.

SOFT SEAT

This system is comprised by a polymer seat, usually virgin PTFE or glass filled PTFE, with a configuration that allows excellent sealing levels.

Description	Shaft orientation	Shutoff Class
One soft seat plus one seat retainer	Downstream	VI
	Upstream	VI

METAL SEAT

Metal seats are used in applications where operating temperatures exceed the soft seat limits.

Description	Shaft orientation	Shutoff Class
One metal seat	Downstream	IV
	Upstream	IV

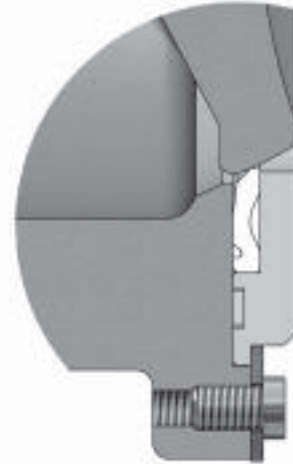

DUAL SEAT

This system is comprised by a soft seat and a metal seat that provides an extra sealing.

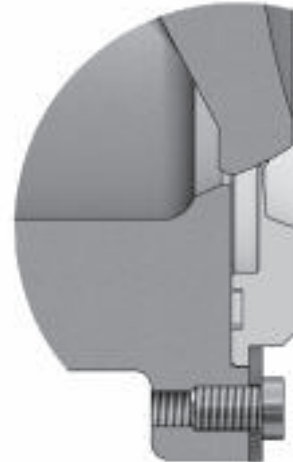

Description	Shaft orientation	Shutoff Class
One soft seat plus one metal seat	Downstream	IV
	Upstream	IV

Note: contact Valtek Sulamericana Application Engineering to assist in flow direction selection on special applications.

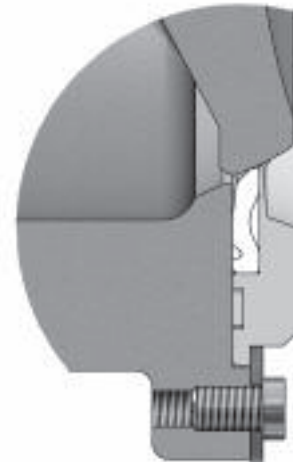

SOFT SEAT (FIGURE 4)

METAL SEAT (FIGURE 5)

DUAL SEAT (FIGURE 6)

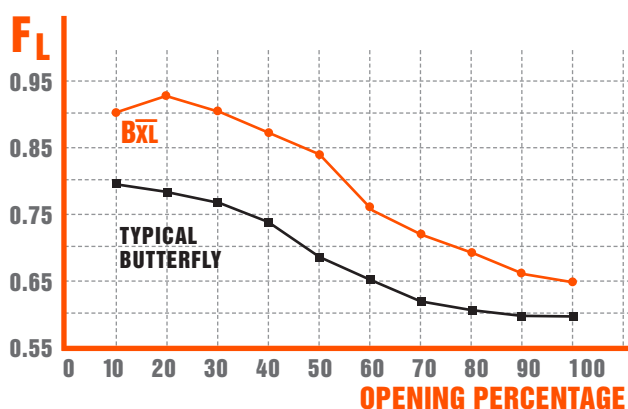

SPECIFICATIONS

Pressure Recovery Factor, FL

The liquid pressure recovery factor, FL, indicates the amount of pressure that will be recovered between the “vena contracta” point and the valve outlet. It takes into account the influence of the valve internal geometry on the maximum capacity of the valve and the tendency that the valve presents to operate with cavitation or choked flow. Smaller FL values indicate that the valve will cavitate earlier.

Figure below compares the FL values of a BXL with a typical butterfly valve. The BXL FL values are between a typical butterfly and globe valve values. So, the tendency to cavitate or choke will be more than a globe valve, but less than a typical butterfly valve.

PRESSURE AND TEMPERATURE LIMITS FOR GASKETS (TABLE II)

ROTARY ACTUATOR SERIES RA-XL (FIGURE 7)

**High parts interchangeability -
Reduces the need for spare parts**

**Lightweight and compact design -
Helps handling and needs limited space**

Actuators

The RA-XL spring-cylinder rotary actuator combines high torque and pneumatic stiffness with an excellent controllability. These characteristics are integrated into a single, rugged, lightweight and compact assembly, which makes it the ideal choice for rotary valves driving.

The RA-XL double acting spring-cylinder actuator is designed to operate with air supply pressures up to 150 psi (10.3 Bar), reaching high operating torques. The actuator Series RA-XL has a proven lifetime longer than a million of cycles, which makes it the most reliable actuator in the market. The double acting positioner feeds both cylinder chambers simultaneously, ensuring an exceptional stiffness. This pneumatic stiffness makes the actuator Series RA-XL insuperable when an accurate control of the valve positioning is required, even when the valve is operating at small openings.

These features enable a much better performance of the actuator Series RA-XL when compared with the spring-diaphragm type actuators.

Yoke	Ductile Iron
Transfer Case	Anodized Aluminum
Splined Lever Arm	Nickel Plated Ductile Iron
Actuator Stem	UNS S 41600 Stainless Steel
Bearings	Teflon reinforced with fiberglass filaments
Sliding Collar	Delrin®, Aluminum
Cylinder Retaining Ring	Zinc Plated steel
Piston	Anodized Aluminum
Cylinder	Anodized Aluminum
O-rings*	Buna N (Standard)
Actuator Spring	Steel (corrosion proof)
Spring Button	Carbon Steel

* Room temperature higher than 180°F (82°C) require Viton o-rings.
Temperatures lower than -40°F (-40°C) require Fluorsilicone o-rings.

The Chronos IDP7600 positioners are digital-to-pneumatic instruments with microprocessed technology that use the HART® protocol to allow remote communication. The two-wire power supply, made by the control loop, contributes significantly to the reduction of wiring costs. The advanced technology of the two-stage relay and microprocessor allows the positioner provides high response level and accurate control. The Chronos IDP7600 provides a local PID loop with ultrafast loop execution time: lower process variability means higher quality of final product and increased productivity. The reliability, intuitive use and quick setup/calibration make the Chronos IDP7600 the more practical and advanced HART® positioner of the market.

TECHNICAL SPECIFICATIONS AND CONSTRUCTION MATERIALS

Communication Protocol	HART®, version 7
Power Supply	Two-wire, loop powered, 4-20 mA, protected against reverse polarity
Input Signal	4-20 mA (3.8 mA min.)
Compliance Voltage	10.4 Vcc @ 20 mA (typical)
Effective Resistance	520 Ω @ 20 mA (typical)
Characterization	Linear, equal percent or customized, with characterizable curve from 21 points
Mounting Types	Linear actuators Rotary actuators
Strokes	Linear: 0.4 to 12 inches (10.2 to 304 mm) Rotary: 0 to 90°
Pneumatic Supply	Instrument air according to ANSI/ISA 7.0.01 ⁽¹⁾ / Nitrogen
Supply Pressure	30 to 120 psig (2.1 to 8.3 bar)
Operating Temperature	-4 to 167°F (-20 to 75°C)
Operating Humidity	0 to 95% U.R., noncondensing

Housing / Enclosure	Anodized aluminum, low-copper, polyester painting (standard) 300 series stainless steel (optional)
Internal Parts	Aluminum and 300 series stainless steel
Soft Goods	Buna-N, Silicone
Hazardous Area Certifications	Explosion proof, flameproof and non-incendive - IECEx / ATEX / INMETRO
Enclosing Rating	IP66
Electrical Connections	1/2"-14 NPT (standard) M20 x 1.5 (optional)
Pneumatic Connections	1/4" - 18 NPT 1/8" - 27 NPT (pressure gauges)
Weights	Aluminum version: 9.6 lbs. (4.4 kg) Stainless steel version: 20.6 lbs (9.4 kg)
Dimensions	8.4 x 5.7 x 6.5 in. (22 x 15 x 17 cm)

(1) With shaft downstream and PTFE standard packing. (2) Body rating shall not be exceeded, as well the pressure/temperature limits of shaft, seats and bearings. (3) For throttling applications, the actuator stiffness and the opening angle shall be considered.

PACKINGS

THE BXL® PACKING BOX HAS A LARGE DEPTH AND AN EXCELLENT FINISH OF INTERNAL SURFACES, WHICH PROVIDES A LONGER OPERATING LIFE FOR THE WHOLE PACKING SET. DUE TO ITS DESIGN CHARACTERISTICS, THE BXL® PACKING BOX ALLOWS THE USE OF A LARGE VARIETY OF PACKING SYSTEMS FOR A BETTER COMPLIANCE WITH THE MOST STRINGENT STANDARDS CONCERNING FUGITIVE EMISSION CONTROL IN MODERN INDUSTRIAL PROCESSES.

STANDARD PACKING (FIGURE 11)

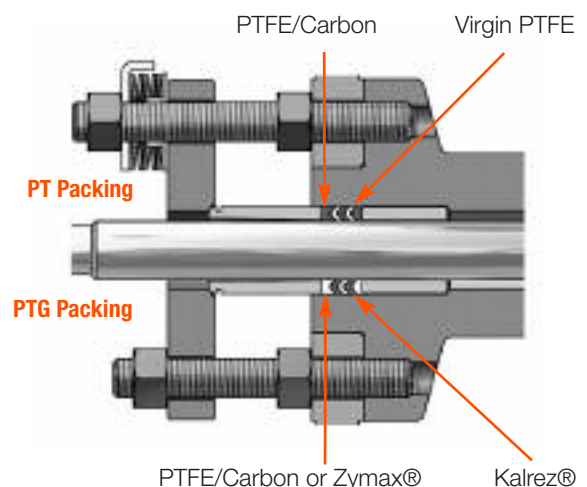

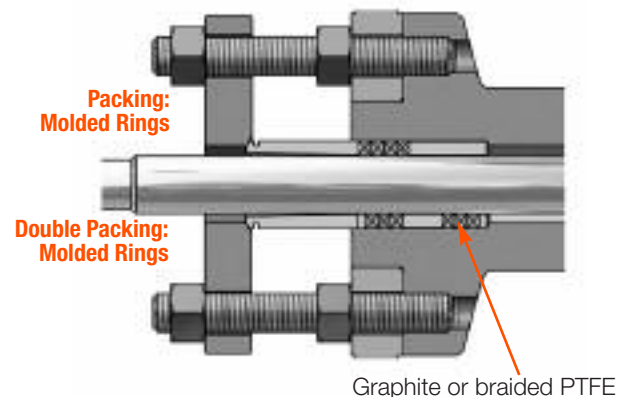

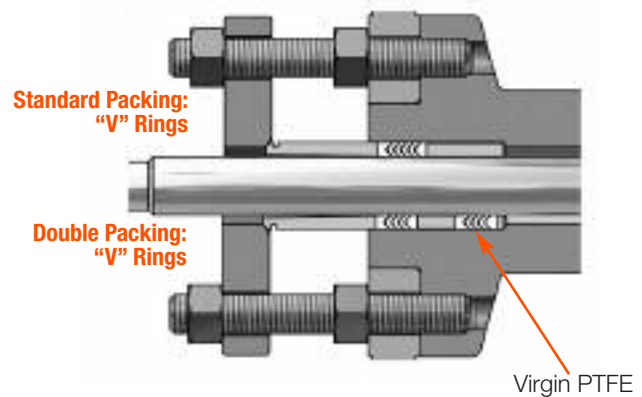

The standard packing of BXL® valves is comprised by PTFE “V” Rings. The PTFE “V” Rings have been the most largely used packing material for many years, with excellent tightness results. Its low friction characteristics, good mechanical strength and excellent corrosion resistance make it the most commonly used material for stem and shaft sealing. The PTFE “V” rings are used in the BXL® valve with operating temperatures from -20 to 450°F (-28 to 232°C).

HIGH TEMPERATURE PACKING (FIGURE 12)

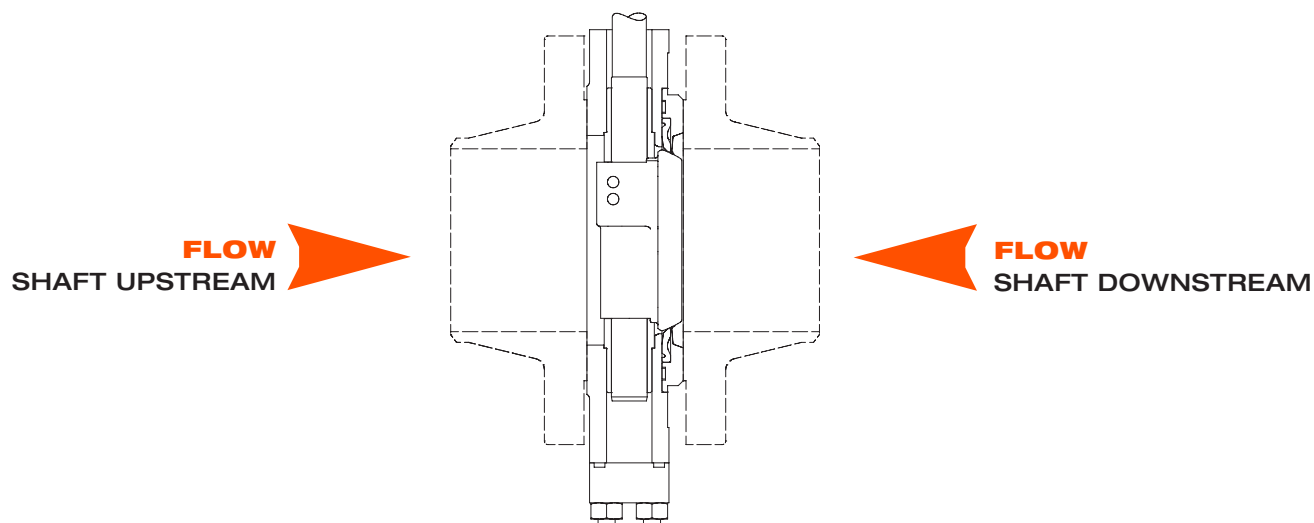

The BXL® packing with molded rings is an option when the operating temperature exceeds the limits of PTFE “V” rings. The materials used for BXL® molded packings are braided PTFE for operating temperatures up to 500°F (260°C) and graphite for operating temperatures up to 600°F (315°C). The graphite molded rings packing is an excellent solution for high temperature applications. However, the high force required for its sealing causes a considerably friction increase in the valve rotation.

SPECIAL PACKINGS (FIGURE 13)

The PT packing type is comprised by a “V” rings set, uniformly and constantly compressed by a mechanical device which includes pairs of belleville washers that acts as springs and provides a “live load” effect. This system reaches a tightness level below 500 ppm. The PT packing type combines the superior quality of virgin PTFE rings with carbon filled PTFE rings. The PTG packing type is comprised by an advanced set of rings able to maintain levels of emission much lower than 500 ppm (usually 10 ppm). The PTG packing combines carbon filled PTFE “V” rings with Kalrez® “V” rings, an advanced material which provides a superior packing performance. The PTG XT packing type is used for higher temperatures, up to 550°F (288°C). It uses Zymax® “V” rings replacing the carbon filled PTFE rings.
